                                                 Question 1
                                                                      Given an array A of sorted integers and another non negative integer k, find if there exists 2 indices i and j such that A[i] - A[j] = k, i!= j.
                                                  Correct
                                                 Marked out of
                                                                      Input Format
                                                  3.00
                                                 Flag question
                                                                     1. First line is number of test cases T. Following T lines contain:
                                                                     2. N, followed by N integers of the array
                                                                     3. The non-negative integer k
                                                                      Output format
                                                                      Print 1 if such a pair exists and 0 if it doesn't.
                                                                      Example
                                                                     Input:
                                                                      1
                                                                     3135
                                                                      4
                                                                      Output:
                                                                      1
                                                                     Input:
                                                                     1
                                                                     3135
                                                                      99
                                                                      Output:
                                                                      0
                                                                      Answer: (penalty regime: 0 %)
                                                                          1 #include<stdio.h>
                                                                          2 v int main(){
                                                                                  int t;
                                                                          3
                                                                                  int k;
                                                                                  scanf("%d",&t);
                                                                                  while(t--){
                                                                                      int n;
                                                                                      scanf("%d",&n);

                                                 Question 2
                                                                      Sam loves chocolates and starts buying them on the 1st day of the year. Each day of the year, x, is numbered from 1 to Y. On days when x is odd,
                                                                      Sam will buy x chocolates; on days when x is even, Sam will not purchase any chocolates.
                                                  Correct
                                                  Marked out of
                                                  5.00
                                                                      Complete the code in the editor so that for each day Ni (where 1 \le x \le N \le Y) in array arr, the number of chocolates Sam purchased (during days
                                                 Flag question
                                                                      1 through N) is printed on a new line. This is a function-only challenge, so input is handled for you by the locked stub code in the editor.
                                                                     Input Format
                                                                     The program takes an array of integers as a parameter.
                                                                      The locked code in the editor handles reading the following input from stdin, assembling it into an array of integers (arr), and calling
                                                                      calculate(arr).
                                                                     The first line of input contains an integer, T (the number of test cases). Each line i of the T subsequent lines describes the ith test case as an
                                                                      integer, Ni (the number of days).
                                                                      Constraints
                                                                     1 \le T \le 2 \times 105
                                                                     1 \le N \le 2 \times 106
                                                                     1 \le x \le N \le Y
                                                                      Output Format
                                                                      For each test case, Ti in arr, your calculate method should print the total number of chocolates Sam purchased by day Ni on a new line.
                                                                      Sample Input 0
                                                                      3
                                                                      1
                                                                      2
                                                                      3
                                                                      Sample Output 0
                                                                      1
                                                                      4
                                                                      Explanation
                                                                     Test Case 0: N = 1
                                                                      Sam buys 1 chocolate on day 1, giving us a total of 1 chocolate. Thus, we print 1 on a new line.
                                                                      Test Case 1: N = 2
                                                                      Sam buys 1 chocolate on day 1 and 0 on day 2. This gives us a total of 1 chocolate. Thus, we print 1 on a new line.
                                                                      Test Case 2: N = 3
                                                                      Sam buys 1 chocolate on day 1, 0 on day 2, and 3 on day 3. This gives us a total of 4 chocolates. Thus, we print 4 on a new line.
                                                                      Answer: (penalty regime: 0 %)
                                                                          1 #include<stdio.h>
                                                                          2 v int main(){
                                                                                 int t;
                                                                                 scanf("%d",&t);
                                                                                 while(t--){
                                                                                      int n,c=0;
                                                                                      scanf("%d",&n);
                                                                                     for(int i = 0;i<=n;i++){</pre>
                                                                                           if(i\%2 != 0) c = c + i;
                                                                                      }printf("%d\n",c);
                                                                         10
                                                                         11
                                                                         12
                                                                              Input Expected Got
                                                                              10
                                                                                     1296

                                                                                     2401
                                                                                                2401
                                                                              98
                                                                       Passed all tests! <
                                                 Question 3
                                                                      The number of goals achieved by two football teams in matches in a league is given in the form of two lists. Consider:
                                                  Correct
                                                  Marked out of
                                                                          Football team A, has played three matches, and has scored { 1, 2, 3 } goals in each match respectively.
                                                  7.00
                                                                          Football team B, has played two matches, and has scored { 2, 4 } goals in each match respectively.
                                                 Flag question
                                                                          Your task is to compute, for each match of team B, the total number of matches of team A, where team A has scored less than or equal to
                                                                      the number of goals scored by team B in that match.

    In the above case:

                                                                          For 2 goals scored by team B in its first match, team A has 2 matches with scores 1 and 2.
                                                                          For 4 goals scored by team B in its second match, team A has 3 matches with scores 1, 2 and 3.
                                                                      Hence, the answer: {2, 3}.
                                                                      Complete the code in the editor below. The program must return an array of m positive integers, one for each maxes[i] representing the total
                                                                     number of elements nums[j] satisfying nums[j] \leq maxes[i] where 0 \leq j < n and 0 \leq i < m, in the given order.
                                                                      It has the following:
                                                                        nums[nums[0],...nums[n-1]]: first array of positive integers
                                                                        maxes[maxes[0],...maxes[n-1]]: second array of positive integers
                                                                      Constraints
                                                                      • 2 ≤ n, m ≤ 105
                                                                      • 1 \le \text{nums}[j] \le 109, where 0 \le j < n.
                                                                      • 1 \le \max[i] \le 109, where 0 \le i < m.
                                                                     Input Format For Custom Testing
                                                                      Input from stdin will be processed as follows and passed to the function.
                                                                     The first line contains an integer n, the number of elements in nums.
                                                                     The next n lines each contain an integer describing nums[j] where 0 \le j < n.
                                                                     The next line contains an integer m, the number of elements in maxes.
                                                                     The next m lines each contain an integer describing maxes[i] where 0 \le i < m.
                                                                      Sample Case 0
                                                                      Sample Input 0
                                                                      5
                                                                     Sample Output 0
                                                                      2
                                                                      Explanation 0
                                                                      We are given n = 4, nums = [1, 4, 2, 4], m = 2, and maxes = [3, 5].
                                                                      1. For maxes[0] = 3, we have 2 elements in nums (nums[0] = 1 and nums[2] = 2) that are \leq maxes[0].
                                                                      2. For maxes[1] = 5, we have 4 elements in nums (nums[0] = 1, nums[1] = 4, nums[2] = 2, and nums[3] = 4) that are \leq maxes[1].
                                                                     Thus, the function returns the array [2, 4] as the answer.
                                                                      Sample Case 1
                                                                      Sample Input 1
                                                                      5
                                                                      10
                                                                      3
                                                                      1
                                                                      7
                                                                      8
                                                                      Sample Output 1
                                                                      1
                                                                      0
                                                                      3
                                                                      4
                                                                      Explanation 1
                                                                      We are given, n = 5, nums = [2, 10, 5, 4, 8], m = 4, and maxes = [3, 1, 7, 8].
                                                                      1. For maxes[0] = 3, we have 1 element in nums (nums[0] = 2) that is \leq maxes[0].
                                                                      2. For maxes[1] = 1, there are 0 elements in nums that are \leq maxes[1].
                                                                          For maxes[2] = 7, we have 3 elements in nums (nums[0] = 2, nums[2] = 5, and nums[3] = 4) that are \leq maxes[2].
                                                                      4. For maxes[3] = 8, we have 4 elements in nums (nums[0] = 2, nums[2] = 5, nums[3] = 4, and nums[4] = 8) that are \leq maxes[3].
                                                                      Thus, the function returns the array [1, 0, 3, 4] as the answer.
                                                                      Answer: (penalty regime: 0 %)
                                                                          1 #include<stdio.h>
                                                                          2 v int main(){
                                                                                  int s1,s2,ans;
                                                                                  scanf("%d",&s1);
                                                                                  int ta[s1];
